

AUDIO BROADCAST IN CORDLESS DIGITAL SYSTEM

ABSTRACT

5

A cordless digital telephone system which allows audio broadcasts is provided. Time division multiple access (TDMA) cordless phone systems provide a base unit which is able to provide connections for a plurality of mobile units, such as handsets. With time division, the mobile units are synchronized to different time slots. A broadcast mode is provided that causes the mobile units to be placed in a receive only mode and to
10 synchronize to the same time slot where a broadcast message is sent.
